

QuEChERS Extraction Kit Test Report

1. Purpose

This test is based on the QuEChERS pretreatment method as described in the Multi-residue Analysis Method (V) of the Residue Pesticide Test Method for Foods and Drugs. Announced by the Food and Drug Administration of the Ministry of Health and Welfare of the Republic of China (Taiwan), LC/MS/MS and GC/MS/MS analysis was used to compare the recovery rates of extraction and cleanup powders of Finetech's QuEChERS versus leading brands.

2. Test Range

Multi-residue analysis was conducted on 373 pesticides (including abamectin) for fruits, vegetables, cereal grains, and teas.

3. Experiment Overview

The experiment was divided into two groups: experimental group (FT) and a control group (CG). Reagents from brands "S" and "J" were used to prepare the extraction and cleanup powders for the control. Three types of matrices, fruits and vegetables, cereal grains, and teas were prepared according to the QuEChERS method. The experiment was performed in triplicates. The concentration was diluted to 0.02 μ g/mL, and the recovery rate and sample deviation was calculated. The reagents in each group are shown in the Table 3.1 below:

Experimental Group: FT	Control Group: CG
Anhydrous magnesium sulfate	
Anhydrous sodium acetate	
PSA	
GCB	
C18	

Table 3.1: Test components in each group.

4. Lab Instruments and Equipments

a) Instruments

1. Liquid Chromatography Tandem Mass Spectrometry (LC-MS/MS):
LC Brand - Agilent, Model - 1290 Series.

- Tandem MS Brand - Agilent, Model - 6470 TripleQuard LC/MS.
2. Gas Chromatography Tandem Mass Spectrometry (GC-MS/MS):
GC Brand - Agilent, Model - 7890A.
Tandem MS Brand- Agilent, Model - 7000C Triple Quad.
- b) Equipments
1. Centrifuge Tubes: 15ml & 50ml, PP material.
 2. Syringe Filter: 0.22µm PTFE (polytetrafluoroethylene) membrane.
 3. Syringe: 5mL plastic syringe.
 4. Micropipettes: 100µL, 200µL, & 1000µL (Class A).
 5. Volumetric Flask: 1mL, 10mL (Class A).
 6. Ceramic Homogenizers: Bond Elut QuEChERS P/N 5982-9313 or equivalent.
(Note: ceramic homogenizers can be used for assessing the viscosity of sample)

5. Preparation of Extraction and Cleanup Powder

- a) Powders
1. Extraction Powder:
Contains 4g of anhydrous magnesium sulfate and 1g of anhydrous sodium acetate.
 2. Cleanup Centrifuge Tube I:
Contains 300mg of PSA and 900mg of anhydrous magnesium sulfate. Load aliquot of 6mL. Suitable for fruits and vegetable samples with high moisture content.
 3. Cleanup Centrifuge Tube II:
Contains 300mg of PSA, 300mg of C18EC, and 900mg of anhydrous magnesium sulfate. Load aliquot of 6mL. Suitable for cereal samples with high moisture content.
 4. Cleanup Centrifuge Tube III:
Contains 450mg of PSA, 300mg of C18EC, 900mg of anhydrous magnesium sulfate, and 50mg of GCB. Load aliquot of 6mL. Suitable for samples with high pigment content and teas.

6. Procedure

1. After samples was homogenized, 10g of fruits and vegetables; 5g of cereal; 2g of tea, were placed in 50mL centrifuge tubes. Then 10mL of cold deionized water was added to the sample and allowed to stand for 20 minutes.
2. To each sample, 200µl of 373 pesticides standard was added. The sample was mixed and allowed to stand for 10 minutes.
3. Then, 100µl of a 5µg/mL internal standard was added.

4. A 10mL acetonitrile solution with 1% acetic acid was added.
5. Extraction powder and ceramic homogenizers were added. The samples were vigorously shaken for one minute.
6. At 15°C, the samples were centrifuge at 8000 rpm for one minute.
7. After, 6mL of the extracted supernatant was transferred to Cleanup Centrifuge Tube I and was shaken vigorously for one minute.
8. At 15°C, the samples were centrifuge at 8000 rpm for one minute. The upper layer was used for analysis of the sample (I).
9. GC-MS/MS: 1mL of the sample (I) was taken and dried completely with nitrogen. The sample was reconstituted with 1mL of acetone/hexane (1:1; V/V) solution. After thorough mixing, the sample was filtered into a 2mL amber vial with a 0.22µm syringe filter and then analyzed by GC-MS/MS.
10. LC-MS/MS: 1mL of the sample (I) was taken and dried completely with nitrogen. The sample was reconstituted with 1mL of methanol. After thorough mixing, the sample was filtered into a 2mL amber vial with a 0.22µm syringe filter and then analyzed by LC-MS/MS.

7. Calibration Standard Solution

a) Matrix Matched Calibration Curve

1. GC/MS/MS

A standard solution of 1µg/mL was used to prepare standard solution concentrations of 0.004, 0.01, 0.02, 0.05, 0.1, and 0.2µg/mL by diluting with a acetone/hexane (1:1; V/V) solution. Then, for each prepared concentration, 100µL of the blank matrix extract was concentrated to a slightly dry state with nitrogen gas. Afterwards, 100µL of each prepared standard solution was added to each of the dried blank matrix extract and mixed thoroughly.

2. LC/MS/MS

A standard solution of 1µg/mL was used to prepare standard solution concentrations of 0.0004, 0.002, 0.005, 0.01, 0.02, 0.03, 0.05, and 0.1µg/mL with methanol. Then, for each prepared concentration, 100µL of the blank matrix extract was concentrated to a slightly dry state with nitrogen gas. Afterwards, 100µL of each prepared standard solution was added to each blank matrix extract and mixed thoroughly. (Note: Fipronil is 0.0004~0.05µg/mL)

8. Conclusion

In this analysis, the concentration of added solution was 0.02µg/mL and the triplicate analysis was performed separately. The recovery rates and repeatability of 20 monitoring compounds were evaluated. The recovery rates and RSD of the experimental group and the control group are shown in Table 8.1. The comparison of recovery rates between the two groups fro fruits & vegetables, cereals, and teas are shown in Figure 8.1, Figure 8.2, and Figure 8.3.

Table 8.1: 20 pesticide standards recovery rate and RSD of experimental (FT) and control group (CG)

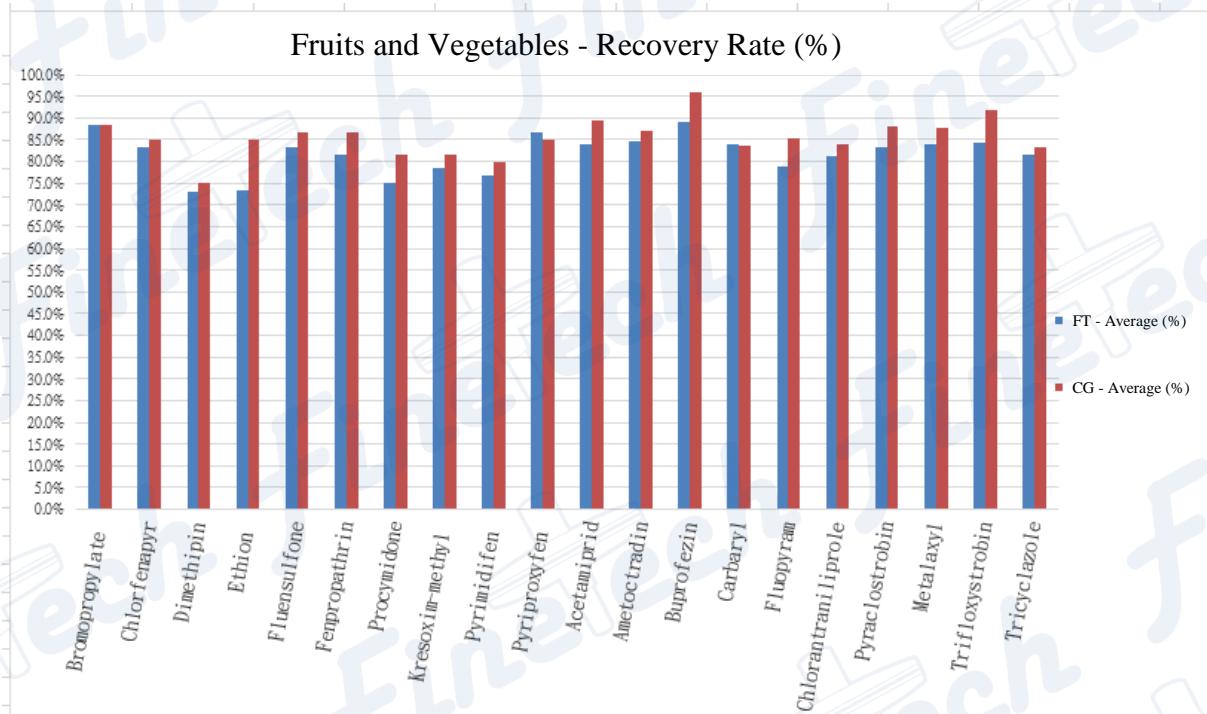

Figure 8.1: Recovery rate of compounds in fruits and vegetables; experimental versus control group

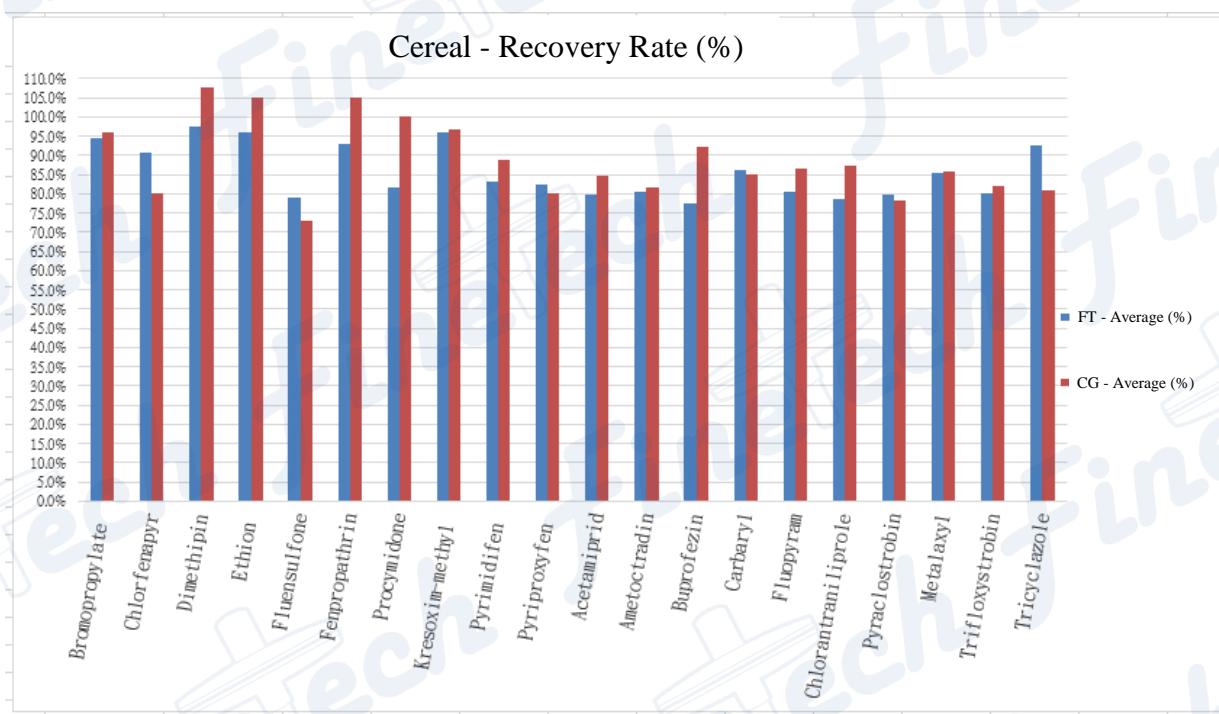

Figure 8.2: Recovery rate of compounds in cereal; experimental versus control group

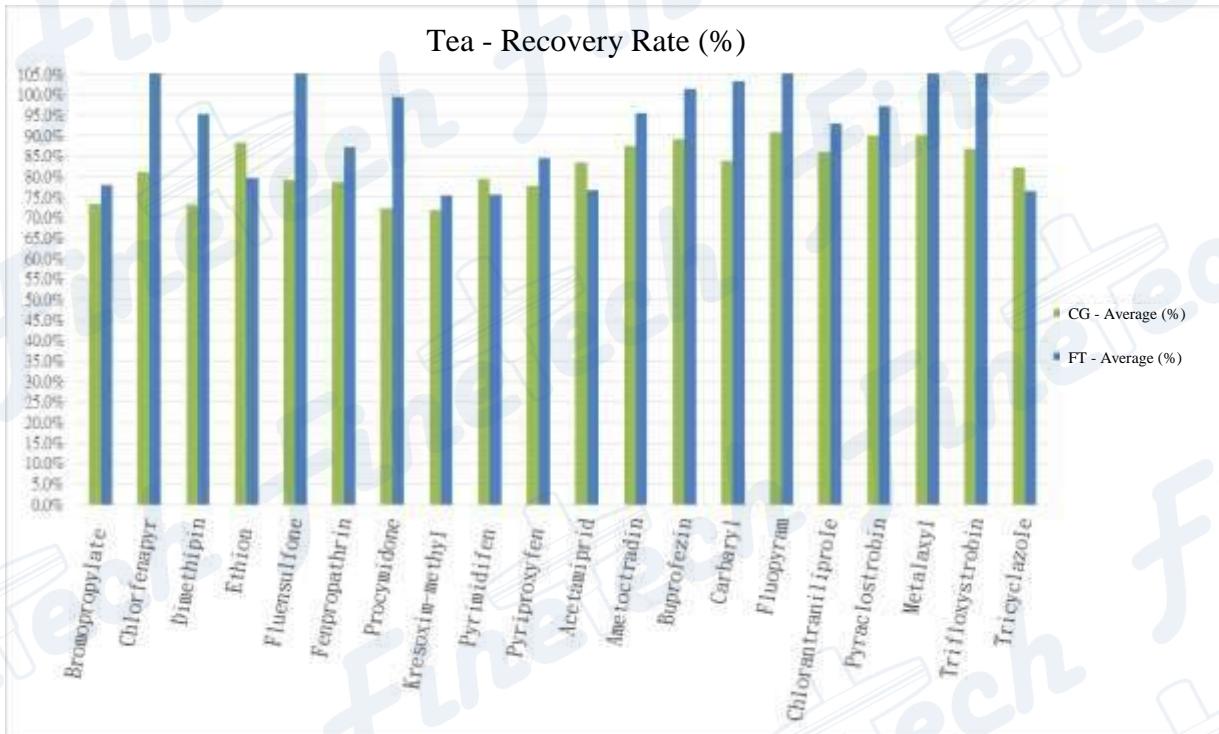

Figure 8.3: Recovery rate of compounds in tea; experimental versus control group

1) Experimental Group FT

The recovery rate of fruits and vegetables was between 73.3%-92.1% (83.2% average), the recovery rate of cereal was between 72.5%-97.5% (85.1% average), and the recovery rate of tea was between 75.4%-111.3% (93.1% average). The average RSD of the three was less than 20%.

2) Control Group CG

The recovery rate of fruits and vegetables was between 75.0%-95.8% (86.3% average), the recovery rate of cereal was between 78.1%-107.5% (91.6% average), and the recovery rate of tea was between 71.8%-90.3% (82.1% average). The average RSD of the three was less than 20%.

The results show that the difference in recovery rate between the experimental group and the control group was not significant. The average recovery rate of the two groups falls between 70.4% and 111.3%, which is an acceptable range in the analysis of multiple pesticide residues.
